CampusPulse — AI + Learning Notes

NxtWave Growth Intern Challenge · how I used AI, and what I decided myself

Tools (ChatGPT and Gemini as I recall them): ChatGPT — campaign brainstorming and plan refinement; Gemini — the five-slide growth-plan deck. **Claude** — built the CampusPulse prototype from my written spec, and reviewed and revised these notes. CampusPulse calls no AI API: its recommendations are fixed rules, its messages are templates, and it is labelled that way on screen. **Record:** prompts and suggestions below are short paraphrases, not verbatim transcripts. The campaign has not been run; all numbers are targets or assumptions.

Plan at a glance	Target	₹	How the target is meant to be reached (assumption)
Clubs + class representatives	200	0	20 admins × ≈10 sign-ups each
Student ambassadors	150	500	15 ambassadors × ≈10 each
WhatsApp communities	100	0	10 admin-approved groups × ≈10 each
Organic social + paid test	50	1,150	Demo reel; boost only if organic interest appears
Optimisation reserve	—	350	Proposed rule: released only to a channel at or above pace on Day 3 or Day 6; otherwise unspent
Total (7 days)	**500**	**2,000**	≈45 planned sources (20 club/class-rep contacts + 15 ambassadors + 10 WhatsApp group admins) plus social; none confirmed

"≈10 per source" is a planning assumption, not a measured rate. **Proposed, unvalidated decision rule (not a benchmark):** on Day 3, treat a channel as "behind" below ≈30% of its target (70% of its pro-rata pace); release the ₹350 reserve only to a channel at or above pace on Day 3 or Day 6; otherwise it stays unspent. **Planned procedures, not built:** a separate registration form and tracking spreadsheet, one tracked link per channel, a code per ambassador, and duplicate removal by email/phone, counting unique registrations only. **CampusPulse does not currently collect registrations or generate codes.**

1. Channel plan: reach versus trust

Tool	ChatGPT
What I asked	How should I allocate ₹2,000 over seven days to get 500 final-year engineering students to register?
What AI suggested	Several social platforms, paid promotions, influencers and student communities.
What I changed — and why	I kept four channels and cut influencers and multi-platform spend. I cannot verify influencer reach for ₹2,000, and I assume (unproven) that students respond more to clubs and peers they know. Trade-off: reach is limited to networks I can recruit. I held ₹350 back; my proposed rule releases it only to a channel at or above pace on Day 3 or Day 6, otherwise it stays unspent.
What I learned	A channel split becomes a plan only when it names who must act: ≈45 planned sources (20 + 15 + 10, none yet confirmed) at ≈10 sign-ups each, plus 50 from social. That turns "500" into a recruiting problem, and the ≈10 is the assumption I most need to test early.

2. What to build: a landing page or a decision tool

Tool	ChatGPT (idea); Claude (build)
What I asked	What working asset could support my plan beyond a standard registration page?
What AI suggested	A standard workshop landing page with a registration button.
What I changed — and why	I rejected it: the brief warns many will build one, and I judged distribution and attribution, not the page, to be the hard part. I specified a decision tool instead and set rules for Claude: seeded data labelled as demo, no fake "live" or "AI" status, explainable rule-based recommendations, a template-based message generator, no student data collected. Trade-off: CampusPulse does not collect registrations; that would need the separate form and tracking spreadsheet I plan to set up. Claude disclosed that its first build was one HTML file with CSS charts, not a React project.
What I learned	An asset should change a decision, and its limits belong beside its features.

3. Checking the AI's own work

Tool	Claude
What I asked	Review my plan and notes as one submission, bluntly; later, audit the revision.
What AI suggested	The first review found: an asset name ("LaunchPad Growth Tracker") and features (referral codes, leaderboard, sign-up table) that CampusPulse does not have; a leftover placeholder note; no math behind 500; a vague reserve rule. The second audit found that Claude's own revision had overstated things — a trigger described as matching the prototype when it does not fully, and a "rejection" I had not actually made.
What I changed — and why	I did not accept the revision as written: I asked for the second audit, removed the overstated lines, and am carrying the corrected asset name, unit math and rules into my slides. Claude drafted the fixes; keeping or removing each was my call.
What I learned	AI is a fast checker of consistency between documents, but it also adds confident details nobody verified. Every claim needs a source — the prototype, my own records, or an explicit "assumption" label.

The three questions

What changed between my first idea and the final solution?	The AI's first suggestions (examples 1–2) were broad reach and a landing page. The final plan has a narrow audience, trust-based distribution with a countable ≈45-planned-source target, proposed decision rules, and a tool that supports decisions.
What would I improve with another 24 hours?	Set up the official registration form and tracking spreadsheet (tracked links, codes, duplicate checks), none of which exist yet; test two messages with a few consenting clubs or groups; replace the ≈10-per-source assumption and the unvalidated Day 3 rule with observed numbers; add a reserve-release suggestion to CampusPulse.
What did AI suggest that I rejected, and why?	Broad multi-platform and influencer spend (unverifiable reach at ₹2,000) and a standard landing page (does not help me decide). I also removed AI-drafted claims I could not verify.

Takeaway: Build fast. Measure honestly. Write the decision rule before the data arrives.
